## 1 Introduction

### 1.1 Purpose

The purpose of this document is as a reference for developer or system analyst when developing or propose a solution for program to be developed.

### 1.2 Reference

- Lap DALA PDNA Jkt 2013\_lores.pdf.

### 1.3 Definitions, Acronyms and Abbreviations

- BPBD – *Badan Penanggulangan Bencana Daerah* (Regional Disaster Management Agency).
- DaLA – Damage and Loss Assessment .
- DIMS – Disaster Information System of BPBD DKI Jakarta.
- OSM – Open Street Map.
- JSON – JavaScript Object Notation.
- CSV – Comma-Separated Values.
- RW – *Rukun Warga*, a division of the region of Indonesia under the Village(*Kelurahan*).
- RT – *Rukun Tetangga*, a division of the region of Indonesia under RW.

## 2 JakSAFE services

### 2.1 Description

JakSAFE service is a system to estimate the damage and loss(DaLA) due to flood event in DKI Jakarta. JakSAFE is running as services that will collect the flood report from DIMS every 6 hours. These report data are stored in JakSAFE database. During flood period, JakSAFE will query the report data and compile them into flood hazard shapefile (hazard.shp) that classified the DKI Jakarta area according to the height and duration of flood.

Hazard shapefile then will be analyzed with building shapefile and road shapefile to find both of affected and inundated asset. The result then will be classified by the asset type, subsector, and location (village/*kelurahan*) to obtain the csv file of the summary of affected and inundated asset in each village.

For asset that can be analyzed using spatial data, it will be analyzed using hazard file and aggregate data at predefined administartion level, such as RT, RW, village(*kelurahan*), district(*kecamatan*), city(*kota*), or province(*provinsi*). Hazard file is used to define the location, and the aggregate file is used to defined the number of asset. The result of this process is csv file that consists of affected and inundated asset in each affected area.

After the number of affected and inundated asset is obtained, the next process is calculate the DaLA. DaLA calculation is done by multiplying the number of affected asset with the assumption value of damage and loss. The result of calculation is presented in pdf report and published on JakSAFE user interface and the website of BPBD DKI Jakarta.

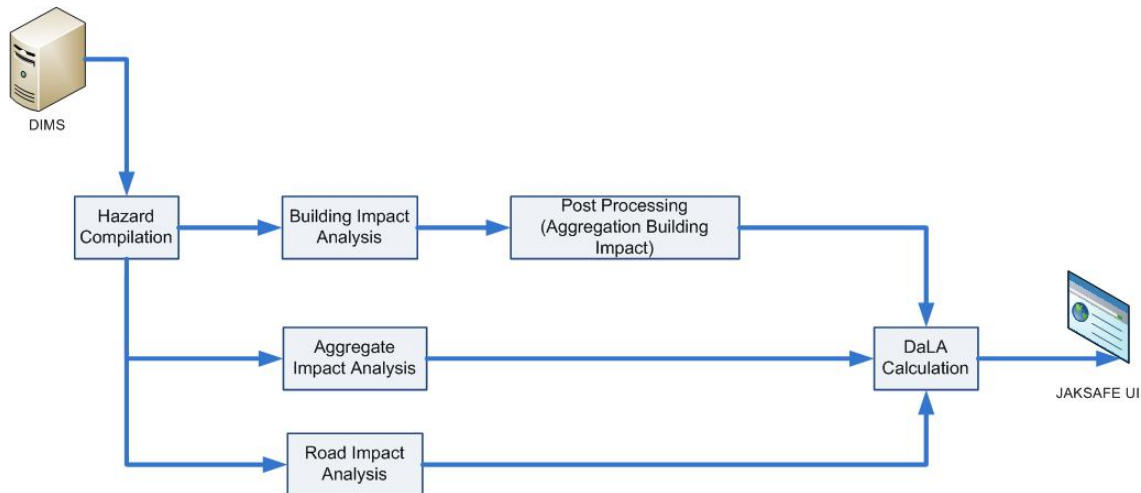

Figure 1. JakSAFE Service Process

## 2.2 Prerequisite

JakSAFE is made based on DaLA report of DKI Jakarta in 2013 by the World Bank. Based on that DaLA report, buildings or assets are categorized into 4 sectors and 15 sub-sectors with the list of assets as follows:

Sector	Subsector	Asset
<i>Produktif</i> (Productive)	<i>Pertanian</i> (Agriculture)	<i>Tambak</i> (Fish Pond)
	<i>Perdagangan</i> (Trade)	<i>Pasar Tradisional</i> (Traditional Market)
		<i>Mal</i> (Mal)
		<i>Restoran</i> (Restaurant)
		Minimarket
		<i>Ruko</i> (Shop house)
		<i>UKM + mikro</i> (Small and micro enterprise)
		<i>Bongkar muat pelabuhan</i> (unloading port)
	<i>Industri</i> (Industry)	<i>Pabrik</i> (factory)
		<i>Perkantoran</i> (office)
		<i>Pabrik kecil</i> (small office)
		<i>Usaha mikro</i> (micro enterprise)
	<i>Pariwisata</i> (Tourism)	Hotel
		<i>Obyek Wisata, layanan turis</i> (tourism object and services)
<i>Sosial dan Perumahan</i> (Social and Residential)	<i>Perumahan</i> (Residential)	<i>Rumah Teratur</i> (regular house)
		<i>Rumah Tidak Teratur</i> (irregular house)
	<i>Kesehatan</i> (Health)	<i>Apotek</i> (pharmacy)
		<i>Rumah Sakit</i> (hospital)
		<i>Puskesmas</i> (health center)
	<i>Pendidikan</i> (Education)	<i>Sekolah</i> (school)
		<i>Universitas</i> (university)

<i>Infrastruktur</i> (Infrastructure)	<i>Transportasi</i> (Transportation)	<i>Fasilitas Olahraga</i> (sport facility)
		<i>Jalan</i> (road)
		Terminal
		<i>Kendaraan</i> (vehicle)
		<i>Kereta api</i> (train)
	<i>Telekomunikasi</i> (Telecommunication)	Provider
		BTS
	<i>Energi</i> (Energy)	SPBU (gas station)
		<i>Gardu PLN</i> (PLN substation)
	<i>Air bersih dan sanitasi</i> (Water and Sanitation)	<i>Instalasi PDAM</i> (PDAM installation)
		MCK
		<i>Pompa Air</i> (water pump)
		<i>Tanggul Air</i> (levee)
<i>Lintas sektor</i> (Cross Sector)	<i>Pemerintahan</i> (Government)	<i>Fasilitas Kepolisian</i> (police facility)
		<i>Fasilitas Pemerintahan</i> (government facility)
		<i>Fasilitas Militer</i> (military facility)
		<i>Rumah Dinas</i> (official residence)
	<i>Lingkungan</i> (Environment)	<i>Taman</i> (park)
		<i>Kebersihan</i> (hygiene)
	<i>Finansial</i> (Finance)	<i>Perbankan</i> (banking)
		<i>Asuransi</i> (insurance)
	<i>Agama</i> (Faith)	<i>Masjid</i> (mosque)
		<i>Gereja</i> (church)
		Vihara

The impact of flood is classified by the duration and height of inundation as follows:

<b>Kelas Dampak</b> Impact class	<b>Tinggi (cm)</b> Height (cm)	<b>Lama (hari)</b> Duration (days)
a1	10-70	<1
a2	71-150	<1
a3	>150	<1
a4	<i>Terdampak</i> (Affected)	<1
b1	10-70	1-4
b2	71-150	1-4
b3	>150	1-4
b4	<i>Terdampak</i> (Affected)	1-4
c1	10-70	5-8
c2	71-150	5-8
c3	>150	5-8
c4	<i>Terdampak</i> (Affected)	5-8
d1	10-70	>8
d2	71-150	>8
d3	>150	>8
d4	<i>Terdampak</i> (Affected)	>8

Calculation of damage and loss is done by multiplying the assumption value of damage and loss with the number of affected assets. Therefore, the assumption data is required in the form of the value of damage and loss of each asset in the respective impact class.

### 3 Detail Process

#### 3.1 Hazard Compilation

##### 3.1.1 Description

Hazard compilation is a module to compile the report of flood event in Jakarta into shapefile to be used as input for DaLA calculation.

##### 3.1.2 Flow

When the jakSAFE service is started and the first request is running, the request time minus 6 hours is set as  $t_0$  (start period of flooding event). Every 6 hours, system will request flood event data in latest 6 hours from DIMS. The response is JSON file that will be parsed and saved into database. If within two consecutive days, the response is null, then the latest time when DIMS give the response is set as  $t_1$  (end period of flooding event).

Before the system start to compile flood report, the system will query the `fl_event` table to check the availability of data from previous two days. If there is no record, then the system will set the request time minus 6 hours as  $t_0$  and request time as  $t_1$ . Otherwise, if there is any data, system will set the request time as  $t_1$ .  $t_0$  and  $t_1$  of each process will be recorded in `auto_calc` table.

The process is started by querying flood event data between  $t_0$  and  $t_1$ , then classified them according the existence of id RT. The query result is saved into csv file, so there will be two csv file, they are report RT and report RW. These report will be compiled with boundary shapefile and `kelas_dampak.csv`. The compilation result of each reports then will be joined as a hazard shapefile (`hazard.shp`).

In case there is more than one record with same location but has different height, the height in that location is determined by taking the average value of height. For example, at RT 01/RW 01, in the first 6 hours (first report) is affected by 50 cm flood. The next 6 hours (second report), there is no report, then the next 6 hours (third report), that loaction is affected by 70 cm flood. When the data is compiled on the third report, the flood height at RT01/RW01 is  $(50+70)/2 = 60$  cm.

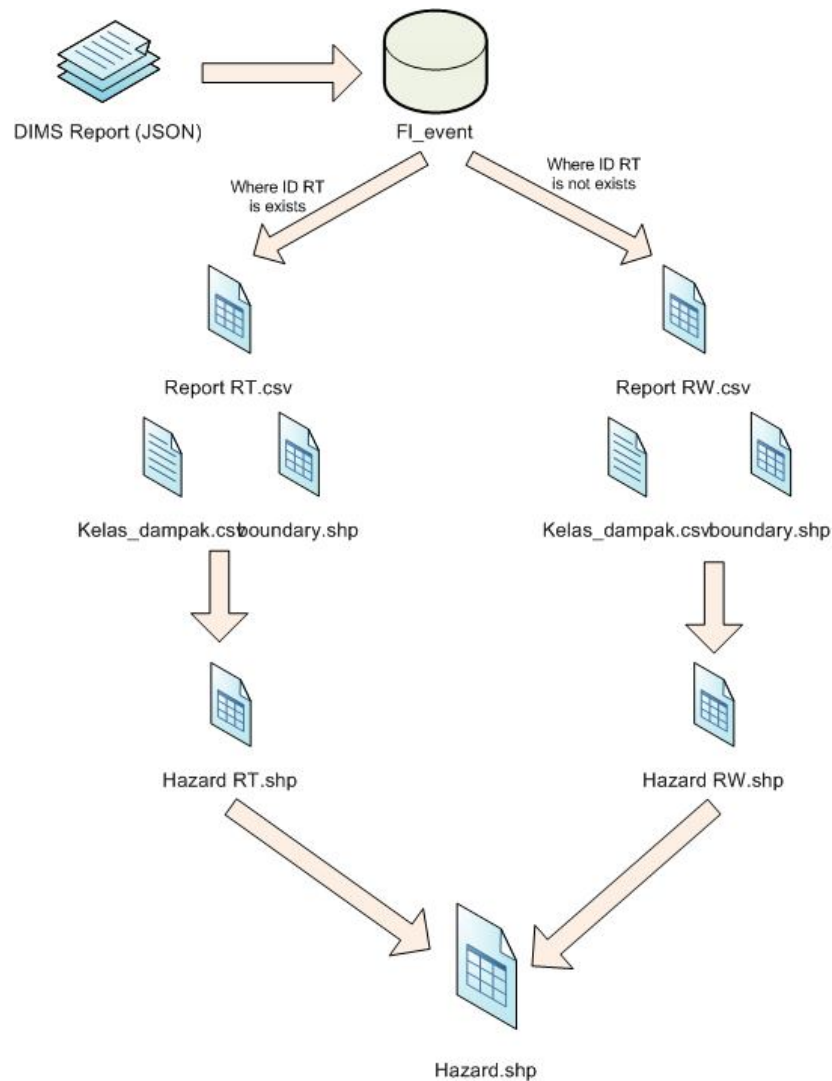

Figure 2. Compile hazard shapefile

### 3.1.3 Format Request Data

The report of flood event is obtained by sending GET request to DIMS via predefined URL. Request parameter is start time and end time.

Request sample : <http://dims.url?starttime=1503181200&endtime=15031759>

The response of that request is the flood event that reported between 18-03-2015 12:00 to 18-03-2015 17:59.

### 3.1.4 Format Laporan Kejadian Banjir (DIMS Response)

The response of DIMS which is the report of flood event is sent in JSON format. This response contains informations as follows :

- Id\_RW : RW identifier, the last three digits represent the RT id. The '000' means the RT id is undefined.
- Waktu kejadian : the time when Village(Kelurahan) reports the event to BPBD.

- *Kelurahan* : the name of affected Village(*Kelurahan*).
- *Kecamatan* : the name of affected District (*Kecamatan*).
- RW: Affected RW.
- RT : Affected RT.
- *Ketinggian* : The height of inundation in those location in centimeters.

The sample of DIMS response:

```
{
  {
    "id_RW" : "31710000000007000",
    "waktu_kejadi an" : "2015-02-24 07: 00: 00",
    "kel urahan" : "nama kel urahan",
    "kecamatan" : "nama kecamatan",
    "RT": "07",
    "RW": "",
    "keti nggi an" : "80"
  },
  {
    "id_RW" : "31710000000008000",
    "waktu_kejadi an" : "2015-02-24 08: 00: 00",
    "kel urahan" : "nama kel urahan",
    "kecamatan" : "nama kecamatan",
    "RW": "08",
    "RT": "",
    "keti nggi an" : "40"
  },
  ...
}
```

### 3.1.5 Database

#### 3.1.5.1 Table *fl\_event* and *fl\_event\_raw*

FI\_event table in JakSAFE database that used to store the report data which sent by DIMS. The structure of fl\_event table are as follows:

Field	Type	Description
Id	int	Sequential unique record id
ID_RW	Big int	Id RW
Village	Varchar	Village name
District	Varchar	District name
RT	Varchar	RT
RW	Varchar	RW
Height	Numeric	Height of inundation in cm
Evt_time	Datetime	Reporting time of flood event
Sync_time	Datetime	Request time to DIMS

The report of flood event from DIMS could contain data which in a location there was two report with different reporting time, such as:

```
{
  {
    "id_RW" : "31710000000007000",
    "waktu_kejadi an" : "2015-02-24 07: 00: 00",
    "kel urahan" : "kampung mel ayu",
    "kecamatan" : "j ati negara",
    "RT": "07",
    "RW": "01",
```

```

        "keti nggi an" : "80"
    },
    {
        "id_RW" : "31710000000007000",
        "waktu_kej adi an" : "2015-02-24 08: 00: 00",
        "kel urahan" : "kampung mel ayu",
        "kecamatan" : "j ati negara",
        "RW" : "07",
        "RT" : "01",
        "keti nggi an" : "40"
    },
    ...
}

```

If there is a kind of these data, then the report data will be saved on `fl_event_raw` and the worstcase data will be stored in `fl_event`.

`Fl_event_raw` is table which have same structure as `fl_event`, that used to store the raw data of DIMS response.

### 3.1.5.2 Table auto\_calc

Table `auto_calc` is a table to stored the record of automatic calculation which runs every 6 hours.

Field	Type	Description
Id	int	Sequential unique record id
T0	Datetime	Starting date of flood event
T1	Datetime	Final date of flood event, request/process time
Damage	Numeric	Estimation of total damage between t0 to t1
Loss	Numeric	Estimation of total loss between t0 and t1

### 3.1.6 Input

The input for each stage of hazard compiliation module are descibed in these following subsections.

#### 3.1.6.1 Report RT dan Report RW

Report RT and Report RW are the result of querying `fl_event` table between `t0` and `t1`, where:

1. Report RT is record which the last three digit of `id_rw` != '000', and
2. Report RW is record which the last three digit of `id_rw` == '000'

The result of query process is saved as csv file and stored in these directory:

- Report RT :  
`/root/auto/output/fl_report/requesttime[YYYYMMDDHHMMSSS]/requesttime_report_RT.csv`
- Report RW :  
`/root/auto/output/fl_report/requesttime[YYYYMMDDHHMMSSS]/requesttime_report_RW.csv`

#### 3.1.6.2 Boundary Shapefile

Boundary shapefile of RT and RW DKI Jakarta. These shapefile are stored in directory:

`/root /auto/input/boundary/boundary.shp`

### 3.1.6.3 Impact Class

Configuration file in csv format to define the limit of height and duration of inundation for each flood impact classification. The column of *kelas\_dampak.csv* are as follows:

1. **Kelas\_dampak** (impact\_class): unique code for impact class, for example a1, a2, b1, b2, etc.
2. **Tinggi\_min** (min\_heigh) : minimum height of impact class(cm).
3. **Tinggi\_max** (max\_heigh): maximum height of impact class(cm).
4. **Durasi\_min** (min\_duration): minimum duration of impact class(days).
5. **Durasi\_max** (max\_duration): maximum duration of impact class(days).

Here is the example of *kelas\_dampak.csv*:

<b>Kelas_dampak</b>	<b>Tinggi_min</b>	<b>Tinggi_max</b>	<b>Durasi_min</b>	<b>Durasi_max</b>
A1	0	4	10	50
A2	0	4	50	150

*kelas\_dampak.csv* file will be stored in directory :  
**/root/auto/config/kelas\_dampak/kelas\_dampak.csv**

### 3.1.7 Output

The output of each stages in hazard compilation module are described in these following subsections.

#### 3.1.7.1 Hazard RT dan RW

Hazard RT is a compilation result of report\_RT.csv, boundary.shp, and *kelas\_dampak.csv*. Hazard RW is a compilation result of report\_RW.csv, boundary.shp, and *kelas\_dampak.csv*. The attributes of hazard RT and RW are as follows:

- ID RT
- ID RW
- *Kelurahan* (Village)
- *Kecamatan* (District)
- *Kota* (City)
- *Rata-rata ketinggian* : The average of inundation height
- *Lama rendaman* : duration of inundation
- Kelas dampak : impact class

Hazard RT and hazard RW shapefile will be stored in directory:

- Hazard RT:  
**/root /Auto/output/hazard /[request time(YYYYMMDDHHMM)]/hazard\_RT.shp**
- Hazard RW:  
**/root /Auto/output/hazard /[request time (YYYYMMDDHHMM)]/hazard\_RW.shp**

#### 3.1.7.2 Hazard Shapefile

This is the final result of hazard compilation module which is the result of joining shapefile of hazard RT and shapefile of hazard RW. The administrative level of hazard shapefile is RT.

The shapefile is stored in directory:

`/root /auto/output/hazard/[start time_endtime (YYYYMMDDHHMMSS)]/starttime_endtime (YYYYMMDDHHMMSS)_hazard.shp`

## 3.2 Shapefile Impact Analysis

### 3.2.1 Description

Shapefile impact analysis is a process to define both the inundated asset and affected asset. Shapefile impact analysis is done by running impact function with hazard shapefile and building shapefile as input file.

In this process, the building shapefile will be overlaid with hazard shapefile, so that the inundated and affected asset can be obtained. The output of this process is building shapefile with additional information of the flooding location, the height of flood, the duration of flood, impact class, and the area of affected asset. The output file will be stored in directory:

`/root/auto/output/impact/[starttime_endtime(YYYYMMDDHHMMSS)]/shapefile/  
[starttime_endtime(YYYYMMDDHHMMSS)]_impact_building.shp.`

The location of building shapefile:

`/root/auto/input/exposure/shapefile/building_exposure.shp`

Figure 3. Impact analysis process

## 3.3 Post Processing (Aggregation Shapefile Impact Analysis)

### 3.3.1 Description

This is the stage after impact analysis to classified the affected asset based on its type, subsector, village and impact class.

### 3.3.2 Process

- Read *subsektor.config* file to determine the subsector that to be found and the type of its asset.
- For each affected asset, classified it according to its type, so that the general type of asset is defined.
- Group the asset based on its village, subsector, impact class and asset type, so that the impact summary is obtained.

Figure 4. Post Processing Building Impact Analysis

### 3.3.3 File Description

#### 3.3.3.1 Impact shapefile

Impact shapefile is the impact analysis result of building shapefile.

#### 3.3.3.2 Subsector config

This is a python configuration file that define the source of exposure data of each asset. Here is the draft of subsector config:

ASET = {}	Array of assets
<pre>ASET['PASAR TRADISI ONAL'] = {     'SEKTOR': 'PRODUKTIF',     'SUBSEKTOR': 'PERDAGANGAN',     'ASET': 'PASAR TRADISI ONAL',     'HAZARD': FALSE,     'IMPACT': 'osm_i mpact. csv'     'DALA': 1 }</pre>	<p>Configuration for assets, example <i>Pasar Traditional</i> Traditional Market)</p> <p>SEKTOR = sector name,  SUBSEKTOR = subsector name,  ASET = asset name,  HAZARD = hazard file, default <b>false</b>,  IMPACT = impact summary csv filename,  DALA = method ID to estimated DALA</p>

This subsector config file is stored in directory : /root/auto/config/subsektor/subsektor.py

#### 3.3.3.3 Impact summary

Impact summary is csv file contains aggregate data on village level of impact building shapefile. The structure of csv file are as follows:

Provinsi (Province)	Kota (City)	Kecamatan (District)	Kelurahan (Village)	Subsektor (Subsector)	Aset (Asset)	Kelas_dampak (Impact_class)	Jumlah_aset (Total_aset)

The location of output file:

/root/jakSAFE/Auto/output/impact/[starttime\_endtime  
(YYYYMMDDHHMM)]/summary/osm\_impact.csv

## 3.4 Aggregate Impact Analysis

### 3.4.1 Description

Not all subsector asset can be obtained from building impact analysis, therefore it takes aggregate impact analysis process to obtain total asset in affected location. Aggregate impact analysis module is used to determine how many assets are affected in flooded area.

### 3.4.2 Process

Figure 5. Aggregate Impact Analysis IO files

- Read config file to find the asset to be calculate using aggregate data.
- For each asset to be calculated using aggregate data:
  - o Find the asset in aggregate file.
  - o Find the location, the location lookup level is start from province to RT. If there is no location information on lower lookup level then the aggregate level is the current lookup level
  - o Example:
    - Asset = BTS
    - Hazard :  
Jakarta Timur; Jatinegara; Kampung Melayu; RW 01; 001; C2
    - Aggregate:  
DKI Jakarta; Jakarta Timur; Jatinegara; Kampung melayu; NULL; NULL; Telekomunikasi; BTS; 7
    - Based on those data above, the hazard level is RT and the aggregate level is Kelurahan
- Define the affected and inundated assets in each RT/RW
  - o Case 1:
    - Hazard level : RT
    - Aggregate level : RT
    - Total Affected Asset = Total asset in RT
  - o Case 2:
    - Hazard level : RT
    - Aggregate level : RW / Kelurahan / Kecamatan / Kota / Provinsi
    - Total Affected Asset = percentage of RT in aggregate level \* total asset in aggregate level
    - Example: RT01/RW 01, Kampung Melayu, Jatinegara, Jakarta Timur is flooded 50 cm for 5 days (C2). Data aggregate is in RW level, that RW 01 Kampung Melayu have 50 school. Area of RT is 1 m2 and area of RW is 5 m2. (The area is known from the hazard shapefile).  
Based on that information, so
      - percentage RT =  $1/5 * 100\% = 20\%$
      - Total school in RT 01 =  $20\% * 50 = 10$  unit.

- Case 3:
  - Hazard level : RW
  - Aggregate level : RT
  - Total Affected Asset = Total asset in each RT in that RW
- Case 4
  - Hazard Level : RW
  - Aggeragate level : RW
  - Total Affected Asset = Total asset in RW
- Case 5 :
  - Hazard level : RW
  - Aggeragate level : *Kelurahan / Kecamatan / Kota / Provinsi*
  - Total Affected Asset = Percentage RW in aggregate level \* total asset in aggregate level
- Affected asset on level RT and RW then will be aggregated into Village level.

### 3.4.3 File Description

#### 3.4.3.1 Hazard shapefile

Hazard shapefile is the output of hazard compilation module. This file is used to specify the affected location and the percentage of affected area.

#### 3.4.3.2 Subsector config

Subsector config is the same config file that used in post processing aggregate building impact analysis. This file is used to determined the assets that should be calculated using aggregate file.

#### 3.4.3.3 Aggregate csv

Aggregate csv is the input file in csv format which contains data of total assets in an administration area. The structure of this file is as follows:

<i>Provinsi (Province)</i>	<i>Kota (City)</i>	<i>Kecamatan (District)</i>	<i>Kelurahan (Village)</i>	<i>RW</i>	<i>RT</i>	<i>Subsektor (subsector)</i>	<i>Aset (asset)</i>	<i>Jumlah aset (total asset)</i>
DKI Jakarta	Jakarta Timur	Jatinegara	Kampung Melayu	01	01	Air bersih dan sanitasi	MCK	6
DKI Jakarta	Jakarta Timur	Jatinegara	Kampung Melayu	02	NULL	Air bersih dan sanitasi	MCK	18
DKI Jakarta	Jakarta Timur	Jatinegara	Kampung Melayu	NULL	NULL	Telekomunikasi	BTS	20
DKI Jakarta	Jakarta Timur	Jatinegara	NULL	NULL	NULL	Lingkungan	Taman	5
DKI Jakarta	Jakarta Timur	NULL	NULL	NULL	NULL	Energi	Gardu PLN	38
DKI Jakarta	NULL	NULL	NULL	NULL	NULL	Transportasi	Terminal	60

The location of aggregate file : **/root/auto/input/aggregat/aggregat.csv**

#### 3.4.3.4 Aggregate Impact Summary

Aggregate impact summary is the result of aggregate impact analysis. This is a csv file which have structure as follows:

<b>Provinsi (Province)</b>	<b>Kota (City)</b>	<b>Kecamatan (District)</b>	<b>Kelurahan (Village)</b>	<b>Kelas Dampak (Impact Class)</b>	<b>Subsektor (subsector)</b>	<b>Aset (Asset)</b>	<b>Jumlah aset (Total asset)</b>
DKI Jakarta	Jakarta Timur	Jatinegara	Kampung Melayu	C2	Air bersih dan sanitasi	MCK	6
DKI Jakarta	Jakarta Timur	Jatinegara	Kampung Melayu	C2	Air bersih dan sanitasi	Pompa Air	3

The location of output file:

**/root/auto/output/impact/[starttime\_endtime (YYYYMMDDHHMM)]/summary/agg\_impact.csv**

### 3.5 Road Impact Analysis

#### 3.5.1 Description

Module to analyze the affected Jakarta Road. The result is the length of affected or inundated road in meters.

#### 3.5.2 Process

- Intersect hazard and road shapefile
- For each road shapefile that intersected with hazard area, find the length of affected road segment.
- The result of road impact analysis is the information of the length, location, and impact class of affected road segment.

Figure 6. Road Impact Analysis

#### 3.5.3 File Structure

##### 3.5.3.1 Road Shapefile (road.shp)

Road shapefile is OSM road shapefile with additional information of the length of the road and the number and coefficient of vehicles that across the road.

<b>Nama Jalan (Road name)</b>	<b>Panjang(m) (Length (m))</b>	<b>Angkot</b>	<b>Bus Sedang (minibus)</b>	<b>Bus Besar (big bus)</b>	<b>Mobil (private car)</b>	<b>Motor (motorcycle)</b>	<b>Truck</b>	<b>Lainnya (others)</b>	<b>K_angkot</b>	<b>K_...</b>
Jend. Sudirman	4125	10	50	20	1000	2000	500	1000	0.1	..

The location of road shapefile :/root/auto/input/exposure/shapefile/road\_exposure.shp

### 3.5.3.2 Summary of road impact analysis

The structure of summary result of road impact analysis are as follows:

Nama Jalan (Road name)	Panjang(m) (length (m))	KelasDampak (Impact Class)	Provinsi (Province)	Kota (City)	Kecamatan (District)	Kelurahan (Village)	RW	RT
Jend. Sudirman	500	D1	DKI Jakarta	Jakarta Selatan	Kebayoran Baru	Senayan	01	001

The location of output file :

/root/auto/output/impact/[starttime\_endtime  
(YYYYMMDDHHMMSS)]/summary/road\_impact.csv

## 3.6 DaLA Calculation

### 3.6.1 Description

This is a module to calculate the damage and loss based on the summary of impact building post processing, aggregate impact analysis, and road impact analysis.

### 3.6.2 Process

The input of DaLA calculation are building impact summary, aggregate impact, road impact and assumptions file. The output are DaLA report and raw file of calculation process.

DaLA Report consists of two reports, DaLA report of all assets and DaLa report for insurance. The insurance DaLA report is created separately to avoid double counting for losses, because the insurance loss is the value of the claim to be paid to the insured assets affected by flooding events.

Figure 7. File Flow of DaLA calculation

There are 5 ways to estimated DaLA of each asset:

1. DaLA calculation per unit asset
2. DaLA calculation based on the area of asset
3. DaLA calculation based on the length of asset
4. DaLA calculation based on the information of aggregate loss/damage
5. DaLA calculation for insurance

Total Damage and total loss exclude insurance DaLA result are stored in auto\_calc table.

Terminal  
Kereta api (Stasiun)(Train Station)

Apotek  
Rumah Sakit

<i>Bandara (Airport)</i>	<i>Puskesmas</i>
<i>BTS</i>	<i>Sekolah</i>
<i>Taman (Park)</i>	<i>Universitas</i>
<i>Perbankan (kerusakan)(Damage of banking asset)</i>	<i>Fasilitas Olahraga</i>
<i>Asuransi (kerusakan)(Damage of insurance asset)</i>	<i>Gardu PLN</i>
<i>Pasar Tradisional (Traditional Market)</i>	<i>SPBU</i>
<i>Mal</i>	<i>Instalasi PDAM</i>
<i>Minimarket</i>	<i>MCK</i>
<i>Ruko (Shop house)</i>	<i>Pompa Air (Water pump)</i>
<i>UKM+Mikro(Small and micro enterprise)</i>	<i>Tanggul Air (Levee)</i>
<i>Pabrik (Factory)</i>	<i>Fasilitas Kepolisian(Police facility)</i>
<i>Perkantoran (Office)</i>	<i>Fasilitas Pemerintahan (Government Facility)</i>
<i>Pabrik Kecil (Small factory)</i>	<i>Fasilitas Militer (Military Facility)</i>
<i>Usaha Mikro (Micro enterprise)</i>	<i>Rumah Dinas(Official residential)</i>
<i>Hotel</i>	<i>Masjid (Mosque)</i>
<i>Objek Wisata(Tourism object)</i>	<i>Gereja (Church)</i>
<i>Rumah teratur (Regular house)</i>	<i>Vihara</i>
<i>Rumah tidak teratur (Irregular house)</i>	

This calculation method is also used to calculate DaLA for vehicle asset. Before calculating the DaLA, the number of affected vehicle assets should be determined. The number of affected vehicles is calculated according to the inundated or affected roads.

Input for this calculation are:

- Road impact analysis to find the affected road
- Road shapefile to find the number and coefficient of each vehicle
- Assumptions of damage and loss matrix as the damage/loss value

The logic for this calculation are as follows:

- Find the name of affected road from road impact file
- For each distinct road name that has the worst impact class, find the number of affected vehicles. The data of number and coefficient of each vehicle are provided in road shapefile.
- After knowing the number of affected vehicles, damage and loss can be estimated by multiplying the number of affected vehicles with coefficient of asset and the value of appropriate damage/loss matrix.
- Example:

## Road impact analysis

Road Name	Length	Impact class
Panglima polim	100	C1
Panglima polim	50	A2
Fatmawati	5	A4

## Road shapefile

Road name	length	Angkot	Bus sedang	...	Koefisien angkot	Koefisien bus sedang	...
Panglima Polim	900	100	50	...	0.7	0.8	..

#### Damage matrix

Asset	Subsector	A1	A2	...	C1	...	D4
KENDARAAN	TRANSPORTASI	1000000	1000000		2000000		2000000

#### Loss Matrix

Asset	Subsector	A1	A2	...	C1	...	D4
KENDARAAN	TRANSPORTASI	1000000	1000000		2000000		2000000

Based on the road impact analysis, it is found that the affected road is *panglima polim*, and this road has vary impact class, that is C1 and A2. Since C1 is worse than A2 then the impact class of *Panglima Polim* is C1.

From road shapefile, it is known that *Panglima Polim* is accrossed by 100 *angkot*, 50 *bus sedang*. So, the **Damage of vehicle** is

**(Total Angkot \* Coefficient \* Damage Unit) + (Total Bus Sedang \* Coefficient \* Damage Unit) + ..**

The **Loss of vehicle** is

**(Total Angkot \* Coefficient \* Loss Unit) + (Total Bus Sedang \* Coefficient \* Loss Unit) + ..**

#### 3.6.2.1 DaLA calculation based on the area of asset

This function is to calculate the damage and loss according to the area of inundated or affected asset. The calculation method is same as the calculation for unit asset, however it count area of asset instead of number of unit. The area of asset then multiplied by the value of damage and loss from damage/loss matrix.

This function is used to calculate asset of *pertanian* (agriculture) and *lingkungan* (environment), that is *tambak* (fish pond) and *kebersihan* (hygiene).

#### 3.6.2.2 DaLA calculation based on the length of asset

This function is to calculate the damage and loss according to the length of the inundated or affected asset. This calculation is used for the inundated and affected asset which have the length attribute, such as road(*Jalan*).

The calculation method is same as the calculation for unit asset. The length of asset will multiply by the value of damage and loss from damage/loss matrix.

#### 3.6.2.3 DaLA calculaton based on information of aggregate valye of damage/loss

If the known value of loss or damage is aggregate assumptions, then the loss for each area is determined by the percentage of the area. The input is hazard file, aggeragte assumption. The logic of calculation is:

- Look at the aggerate level of aggregate assumption file. If the Province name is known then the assumption level is province, else if the lower level is known then the assumption level is that lower level.

- Calculate the percentage of affected area on the area of aggregate assumptions. The area of affected can be found in hazard shapefile.  
**Percentage of affected area = affected area/total affected area on aggregate level**
- **Loss = percentage of affected area \* value of aggregate loss**
- **Damage =percentage of affected area \* value of aggregate damage**

Asset to be calculate by this function :

- Provider
- Banking (Loss)

### 3.6.2.4 DaLA insurance calculation

The losses of insurance asset is total claim that should be paid by insurance company to their customer. Claim that should be paid is categorized into four types, namely property, motor, engineering, and general accident.

Input for calculation of DaLA insurance as follows:

- DaLA Calculation result
- Assumptions of insurance penetration
- Insurance assumptions

To estimate the losses of property, motor and engineering, the DaLA result of each asset is multiplied by the assumption value of insurance penetration.

**Loss value of general accident is population of Jakarta \* percentage of insurance penetration \* probability of accident \* claim value.** These assumptions can be found on insurance assumptions file.

Example:

DaLA calculation result

Provinsi (Province)	Kota (City)	Kecamatan (District)	Kelurahan (Village)	Subsektor (Subsector)	Aset (Asset)	Kerusakan (Damage)	Kerugian (Loss)
DKI JAKARTA	JAKARTA SELATAN	KEBAYORAN BARU	PETOGOGAN	PERUMAHAN	RUMAH TERATUR	100000000	1000000000
DKI JAKARTA	JAKARTA SELATAN	KEABYORAN BARU	PULO	PERUMAHAN	RUMAH TERATUR	200000000	1000000000

Assumptions of insurance peentration

SUBSEKTOR (Subsector)	ASSET	INSURANCE TYPE	PROVINSI (Province)	KOTA (City)	KECAMATAN (District)	KELURAHAN (Village)	PENETRASI ASURANSI (insurance penetration)
PERUMAHAN	RUMAH TERATUR	PROPERTY	DKI JAKARTA				0.9

Insurance loss for REGULAR HOUSE = (100000000 + 200000000) \* 0.9 = xxxx

### 3.6.3 Assumptions

There are two types of assumption file, namely damage/loss assumption file for each asset and impact class and aggregate damage/loss assumption in an area.

#### 3.6.3.1 Assumptions Matrix

##### 3.6.3.1.1 Damage

Subsektor (Subsector)	Aset (Asset)	A1	A2	A3	A4	B1	B2	B3	B4	C1	C2	C3	C4	D1	D2	D3	D4
Pendidikan	Sekolah																
Kesehatan	Puskesmas																

##### 3.6.3.1.2 Loss

Subsektor (Subsector)	Aset (Asset)	A1	A2	A3	A4	B1	B2	B3	B4	C1	C2	C3	C4	D1	D2	D3	D4
Pendidikan	Sekolah																
Kesehatan	Puskesmas																

#### 3.6.3.2 Matrix of Aggregate assumption

Provinsi (Province)	Kota (City)	Kecamatan (District)	Kelurahan (village)	RW	RT	Subsektor (subsector)	Aset (asset)	Kerugian (loss)	Kerusakan (damage)
DKI Jakarta	Null	Null	Null	Null	Null	Finansial	Perbankan	Null	58000000000
DKI Jakarta	Null	Null	Null	Null	Null	Finansial	Asuransi	Null	30000000000

### 3.6.4 File Description

#### 3.6.4.1 Impact summary

Impact summary is the result of impact summary that stored in directory :

/root/auto/output/impact/[starttime\_endtime (YYYYMMDDHHMMSS)]/summary/

#### 3.6.4.2 Assumptions

Assumptions which used by the system is consists of file assumption and aggregate assumption that has been descibed in previous section, insurance assumptions, and assumptions of insurance penetration.

The structure of insurance assumption is

Asumsi (Assumptions)	Nilai (value)
Populasi DKI Jakarta (Population in DKI Jakarta)	10000000
Kemungkinan Kecelakaan (Probability of accident)	0.000001%
Nilai klaim general accident (General accident claim value)	1000000000

The structure of assumptions of insurance penetration file is:

Subsektor (subsector)	Aset (asset)	Insurance Type (insurance type)	Provinsi (province)	Kota (city)	Kecamatan (district)	Kelurahan (village)	Penetrasi Asuransi (insurance penetration)
Perumahan	Rumah Teratur	Properti	DKI JAKARTA				0.8

These assumption file is save in directory:

- /root /Auto/input/assumptions/asumsi\_kerugian.csv
- /root /Auto/input/assumptions/asumsi\_kerusakan.csv
- /root /Auto/input/assumptions/asumsi\_aggregat.csv
- /root /Auto/input/assumptions/asumsi\_asuransi.csv
- /root /Auto/input/assumptions/asumsi\_penetrasi asuransi.csv

When the calculation process is running, these file will be copied to this directory:

- /root/jakSAFE/Auto/output/ assumptions /[starttime\_endtime(YYYYMMDDHHMMSS)] /

### 3.6.4.3 Metadata of Assumptions

This is a file that contains the source of assumption that used by each asset.

Aset (Asset)	Sumber (source)
Sekolah	DaLA DKI Jakarta 2013, World Bank
Universitas	DaLA DKI Jakarta 2013, World Bank

This file is saved in the same directory as assumption file.

### 3.6.4.4 DaLA Report

The result of DaLA calculation is in form of csv file contains detail calculation result and pdf file contains the summary of DaLA with chart.

1. Result of DaLA for each subsector

The structure of csv file is

Provinsi	Kota	Kecamatan	Kelurahan	Subsektor	Aset	Kerusakan	Kerugian

Filename : **DaLAsubsector\_starttime\_endtime(YYMMDDHHMMSS).csv**

2. Summary of calculation on City Level

The structure of csv file is

Sektor	Subsektor	Asset	Kota	Kerusakan	Kerugian

Filename : **DaLAsummary\_starttime\_endtime(YYMMDDHHMMSS).csv**

The pdf filename is **DaLA\_starttime\_endtime(YYMMDDHHMMSS).pdf**

File location: /root/jakSAFE /output/report/[starttime\_endtime(YYYYMMDDHHMM)]/

## 4 User Interface and Function

### 4.1 Description

JakSAFE service is running on background. The user interface is needed to view the report of calculation and process log, configure data input and output, and to calculate DaLA for specific period of time. The interface is build as a web based application.

### 4.2 Menu

- Automatic Report
- AdHoc DaLA
- Flood Reports
- Settings
- Information
- Login/Logout

### 4.3 Automatic Report

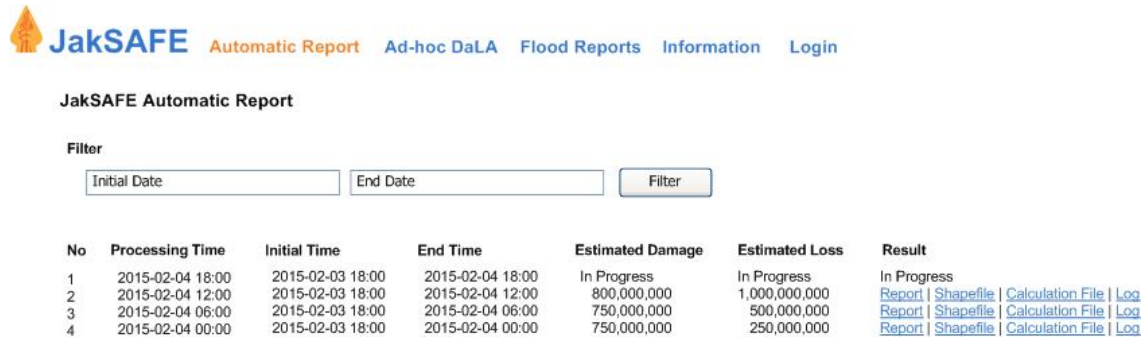

Figure 8. JakSAFE Interface - Automatic Report

This is the page to see the estimation value of DaLA every 6 hours and download the detail report. The component of automatic report page are as follows:

Page Element	Type	Description
initialDate_filter	Textbox, datepicker	Field to input the initial date to filter the automatic calculation record
endDate_filter	Textbox, datepicker	Field to input the end date to fileter the automatic calculation record
Filter	Button	Button to filter the record of automatic calculation during the initial date to end date
Report_table	Table	Table which consists of record from auto_calc table. The records are sorted descending by processing time. <ul style="list-style-type: none"> <li>- Processing time = auto_calc.t1</li> <li>- Initial time = auto_calc.t0</li> <li>- End time = auto_calc.t1</li> <li>- Estimated damage = auto_calc.damage. If null then the value in row is 'In Progress'</li> <li>- Estimated loss = auto_calc.loss, if null then the value in row is 'In Progress'</li> <li>- Result = link to download the detail result of calculation</li> </ul>

#### 4.3.1 Functionality

##### 4.3.1.1 Filter

- To filter the record by the initial date and end date
- When the user click 'Filter' button, the report table will show the record calculation that has been done between initial date and end date. The initial date and end date is used as range of field t1 when querying adhoc\_calc table.
- Both startdate and enddate is required. Date format is 'YYYY-MM-DD'

##### 4.3.1.2 Download Result

- Fuction to download the DaLA calculation result, it consists of :
  - o **Report**  
When this link is clicked, then the pdf report file will be downloaded.
  - o **Shapefile**  
When the shapefile link is clicked then the zip file which consists of hazard shapefile and impact analysis shapefile will be downloaded.
  - o **Calculation File**  
When the calculation file is clicked then the zip file which consists of aggregate impact summary, building impact summary, road impact summary and DaLA calculation table will be downloaded.
  - o **Log**  
When the log is clicked then the log process file will be downloaded.

#### 4.4 AdHoc DaLA

Figure 9. User Interface AdHoc DaLA report

This is the page to view DaLA report for specific period that defined by user. There are two interface for adhoc DaLA. The interface for public user and interface for login user. At user login interface, there are functionality to generate DaLA reports.

The component in JakSAFE adhoc DaLAreport is as follows:

Form element	Type	Description
Initial_date	Textbox, datepicker	Initial date of DaLA calculation.
End_date	Textbox, datepicker	End date of DaLA Calculation.
Create_report	Button	Button to start DaLA calculation.
AdHoc Report	Tabel	Table which consits the summary of adhoc calculation result. Data is taken from adhoc_calac table, sort descending Initial date = adhoc_calc.t0 End date = adhoc_calc.t1 Estimated damage = adhoc_calc.damage, if there is no value yet then the value is 'In Progress' Estimated loss = adhoc_calc.loss, if there is no value yet then the value is 'In Progress' Result = link to download the details of calculation result. If the calculation is running, show the progress bar.

#### 4.4.1 Functionality

To calculate DaLA in specific period of time. This function only available for login user.

On click 'Generate Report' button:

- System will read the input data (initial date and end date)
- End date should be greater than input date.
- If input validation is succeed then system will start the adhoc DaLA process, starting from Hazard compilation to DaLA calculation. The detail is explained below.

##### 4.4.1.1 Hazard Compilation

- To query flood event data between t0 (initial time) and t1(end time). This data then will be classified by the existence of ID RT.
- If there is no record found, then the process is finished with 'No Flood Event' on result column.
- The next step is compile the query result with RT and RW boundary shapefile and *kelas\_dampak.csv*. The '*kelas\_dampak.csv*' file is the same file which used in automatic process
- The compilation hazard RT dan RW then merge into a hazard shapefile
- The output is stored in directory :
  - o `/root/ AdHoc/output/hazard/[starttime_endtime(YYYYMMDDHHMMSS)]/`

##### 4.4.1.2 Impact Analysis

- The hazard shapefile will be overlayed with building shapefile. This proces will be resulting the impact shapefile.
- Building data is the building shapefile that used in automatic process
- The output directory is  
`/root/Adhoc/output/impact/[starttime_endtime(YYYYMMDDHHMMSS)]/shapefile/`

##### 4.4.1.3 Post Processing Aggregation Impact Analysis Result

- Aggregating the impact analysis result by its building type, location and impact class
- The process and config file are just like in the automatic process.
- The output directory is:  
`root/adhoc/output/impact/[starttime_endtime(YYYYMMDDHHMMSS)]/summary/`

##### 4.4.1.4 Aggregat Impact Analysis

- To find the affected assets that can not be defined by OSM shapefile.
- The impact analysis process, aggregate file and configuration file that used in this process are the same file as in automatic process.
- The output is stored in this directory:  
`root/adhoc/output/impact/[starttime_endtime(YYYYMMDDHHMMSS)]/summary/`

##### 4.4.1.5 Road Impact Analysis

- The hazard shapefile will be overlayed with road shapefile. This proces will be resulting the impact shapefile.
- Road data is the road shapefile that used in automatic process
- The output directory is

`/root/jakSAFE/Auto/output/impact/[starttime_endtime(YYYYMMDDHHMMSS)]/shapefile/`

#### 4.4.1.6 DaLA Calculation

- To calculate the damage and loss for the affected assets
- The process flow and assumptions file are same as in the automatic process.
- The output will be stored in this directory:  
`/root/jakSAFE/adhoc/output/report/[starttime_endtime(YYYYMMDDHHMMSS)]/`
- Total damage and loss will be saved into `adhoc_calc` table

#### 4.4.2 Download Calculation Result

- The feature to download calculation result is same as the feature in automatic report page.

#### 4.4.3 Database structure

`Adhoc_calc` table is a table to store the record of `adhoc` calculation. The structure of `adhoc_calc` table are as follows:

Tabel 1. `adhoc_calc`

Field	Type	Description
Id	int	Sequential unique record id
Create_date	Datetime	Create date of <code>adhoc</code> report
T0	Datetime	Start date to query flood event from <code>fl_event</code> table
T1	Datetime	End time to query flood event from <code>fl_event</code> table
Damage	Numeric	Estimated value of total damages during <code>t0</code> to <code>t1</code>
Loss	Numeric	Estimated value of total losses during <code>t0</code> to <code>t1</code>

### 4.5 Settings

This menu only can be accessed by login user.

#### 4.5.1 Global Config

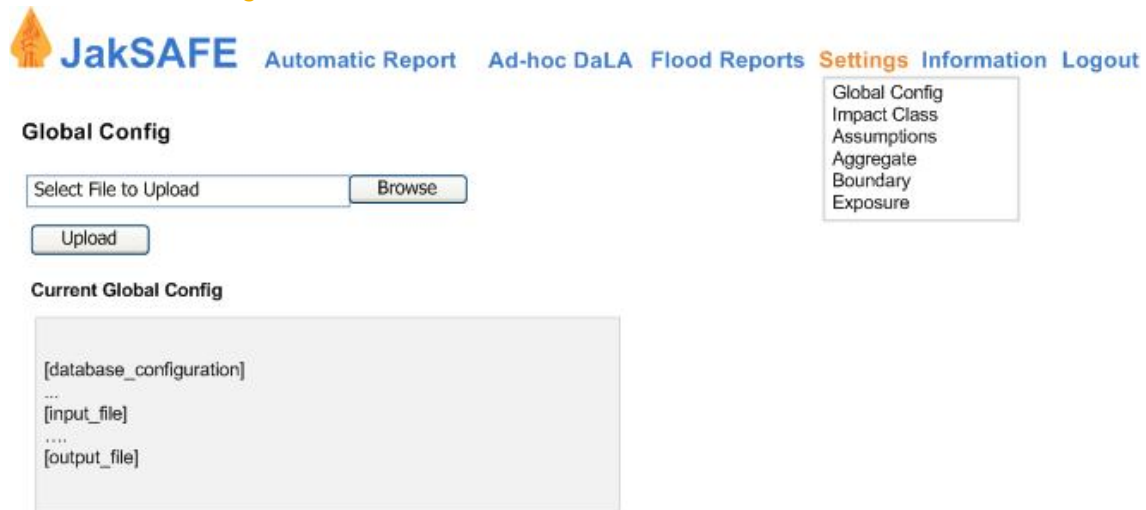

Figure 10. Global config settings

This is page to view the current configuration that used in calculation process. Component of global config page are as follow:

Form element	Type	Description
File select	Textbox	Textbox which show the location and name of selected file.
Browse	Button	Button to search '*.cfg' file to be uploaded
Upload	Button	Button to upload cfg file Onclick : 1. System will validate the format of file. The extention of file must be .cfg 2. System will replace the curreny cofiguration file with new file
Global config	Textarea, disabled	Diabled text area which display the content of global_config.cfg file.

#### 4.5.2 Impact Class

**JakSAFE** Automatic Report Ad-hoc DaLA Flood Reports Settings Information Logout

Page to download and upload boundary shapefile. Boundary shapefile is the file that used in hazard compilation process. Shapefile is consists of five files, shp, shx, dbf, prj, and qpj. The component of this page are as follow:

Form element	Type	Description
File select	Textbox	Textbox which show the location and name of selected file. Each shapefile component has its own file select.
Browse	Button	Button to search aggregate csv file to be uploaded. Each shapefile component has its own file select.
Download File	Button	Button to download the shapefile component. Each shapefile component has its own file select.
Upload All	Button	Button to upload all shape file Onclick : <ol style="list-style-type: none"> <li>1. System will validate the format of file. The extension of file must be .shp, shx, dbf, prj, and qpj.</li> <li>2. System will replace the existing boundary files with new file</li> </ol>

#### 4.5.6 Exposure

Figure 15. Exposure Settings

Page to download and upload exposure shapefile. This page consists of two section, building section and road section. Each section contains the following components.

Form element	Type	Description
File select	Textbox	Textbox which shows the location and name of the selected file. Each shapefile component has its own file select.
Browse	Button	Button to search for aggregate CSV file to be uploaded. Each shapefile component has its own file select.
Download File	Button	Button to download the shapefile component. Each shapefile component has its own file select.
Upload All	Button	Button to upload all shapefile. On click : <ol style="list-style-type: none"> <li>1. System will validate the format of file. The extension of file must be .shp, .shx, .dbf, .prj, and .qpj.</li> <li>2. System will replace the existing exposure files with new file</li> </ol>

## 4.6 Login

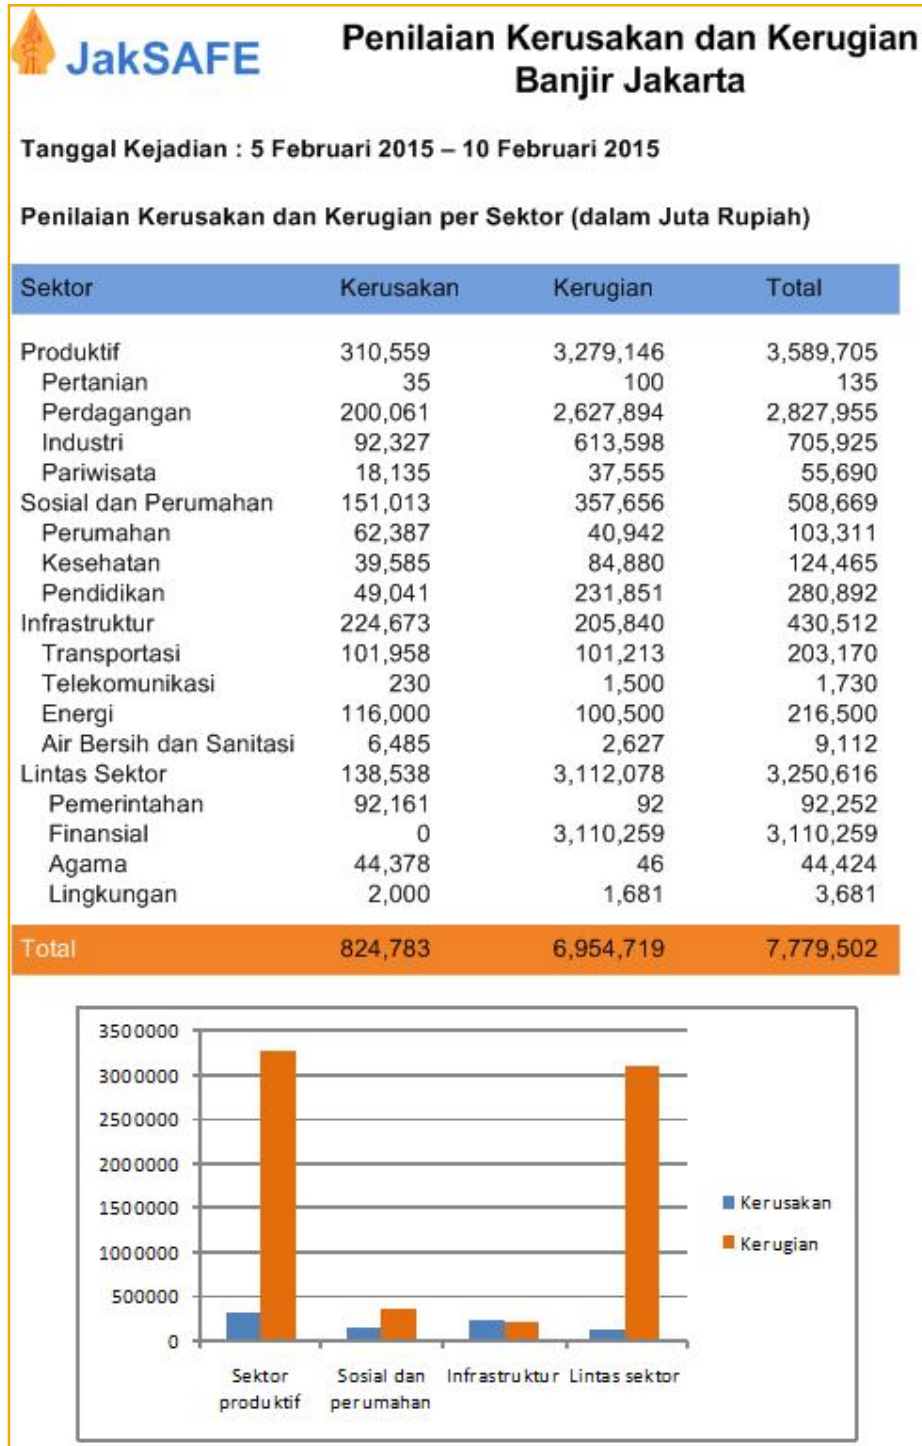

The screenshot shows the JakSAFE web application interface. At the top, there is a navigation menu with the following items: 'Automatic Report', 'Ad-hoc DaLA', 'Flood Reports', 'Information', and 'Login'. The 'Login' item is highlighted in orange. Below the navigation menu, the word 'LOGIN' is centered. Underneath, there are two input fields: one labeled 'username' and another labeled 'Password'. Below these fields is a button labeled 'Login'.

Figure 16. Login page

Page to login to JakSAFE. When user is login, they can view the settings menu and generate adhoc report.
